

Increase productivity while minimizing costs

Archivum is a cloud solution that enhances the way your data is stored - accessible from anywhere, cost-beneficial and compliant with legal requirements.

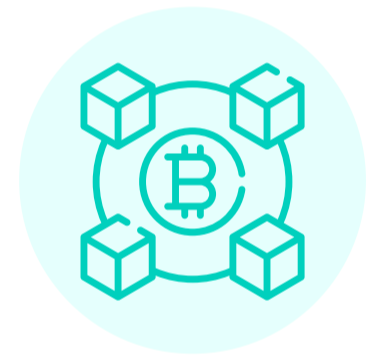

Simple

- + A **simple and intuitive interface** allows any user to easily find and retrieve files, no matter how long ago they have been stored. Employees, customers or auditors won't need any guidance while looking up documents on their own.
- + **Granular access rules** make rights transparent and help to protect the privacy of your documents within your organization. Easily grant and restrict access via roles and identities which map to **existing security access levels**.

Secure

- + Following a **zero-trust** approach, all file operations are logged and presented in audit trails. Once a day, details of all new logs are captured in a daily timestamp and submitted to the Bitcoin blockchain, **after which they cannot be tampered with anymore**.
- + By storing all information publicly, the authenticity of any file can be **verified independently**. No operation within Archivum goes unnoticed, since each and every one becomes a fingerprint inside the decentralized system.

Efficient

- + Archivum automizes your organization's archive management and helps you **save up to 70% of the costs for storage and maintenance** while ensuring nothing gets lost over the years.
- + Automatically store your unproductive data on lower-priced storage tiers and delete files that are no longer needed.
